Payment Risk Analytics Manager
Risk Management, Uber Inc.
555 Market St
San Francisco, CA 94105

Yi Li,

I want to take a moment to thank you for taking time out of your calendar to meet with me this past Wednesday.

I thoroughly enjoyed the nuanced questions you posed for querying during our discussions – especially the challenges of not leveraging a distinct function. It's always a joy conducting code reviews with someone as interested and knowledgeable about the technical side of fraud analytics as you are..

Here's some literature about the nodupkey function in SAS that you might find interesting:

- SAS Noduprecs: <http://www2.sas.com/proceedings/sugi30/037-30.pdf>

There are similar functions in dplyr for R as well.

Additionally, I realize we ran a little short on time while discussing the various types of fraud in the marketplace. Interview aside, please reach out to me if you had any further questions – I'm a strong believer in industry partnerships when it comes to combatting fraud and would be more than happy to continue our conversation.

I look forward to opportunity to collaborate with you in the future.

Sincerely,

Jason L. Seto
